

Dear all,

Many of you have reported that there is an issue with incorrect EIRP reported on the map. The issue is caused by the limitation of 125 dots per polygon that was introduced in Google Maps API V2 without any advanced notice. As a result all the most precious maps are reporting wrong values despite the fact that all the data is correct in our Database.

To eliminate this issue we need to urgently upgrade the footprints page to the latest Google maps API. As we need to port a lot of functionality, it will probably take some time until the issue is completely resolved.

We will keep on posting the updates on the issue.

Thank you very much for your understanding and passion!
